# Digital Communication

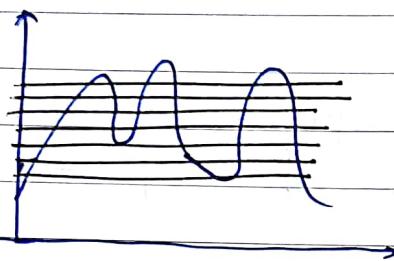

- Digitized  $\rightarrow$  discretized in Levels

Analog : Information is not digitized

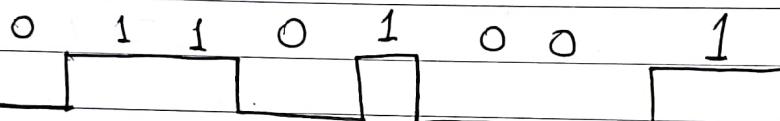

Digital : Information is digitized

Q  $\rightarrow$  What is the point of high precision in Analog.

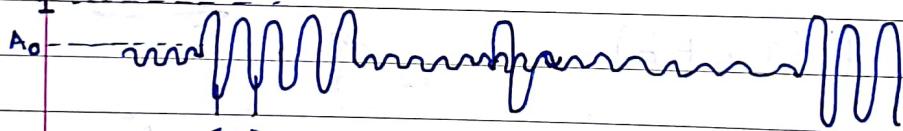

In Digital

AM  $\rightarrow$  ASK (Amp. Shift keying)  
FM  $\rightarrow$  FSK (Freq. " " )  
PM  $\rightarrow$  PSK (Phase " " )

A<sub>1</sub>

(ASK  
Waveform)

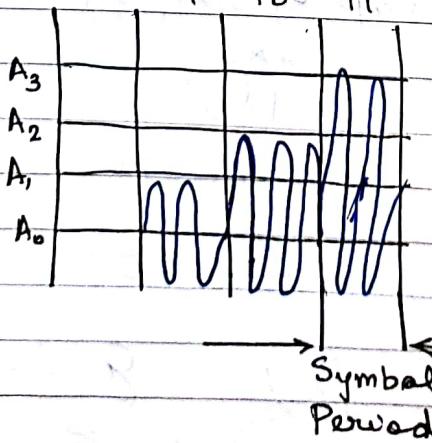

$$\frac{1}{f_c}$$

$\rightarrow$  We can also perform OOK : On-off

Keying, where  
Amp. = 0 for Symbol "0"

$\rightarrow$   $> 2$  Symbols example (4-ASK) in General

M-ASK  
M-PSK  
etc...

4 Levels or 4 possible  
Symbol values

ex

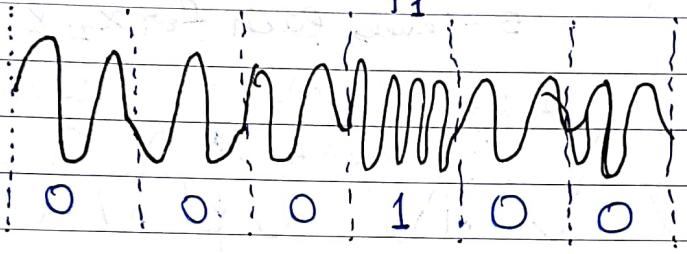

$$\text{Bit-rate} = 1 \text{ Mbps}$$

$$\text{Symbol rate} = \frac{\text{Bitrate}}{\text{Bits/Symbol}} = 500 \text{ Ksym/s}$$

for 4-ASK

$$\text{Sym. rate} = \frac{\text{Bit-rate}}{\lceil \log_2 M \rceil} \quad \text{for M-ASK}$$

FSK :  $(2 \text{ symb. FSK}, 2\text{-FSK})$

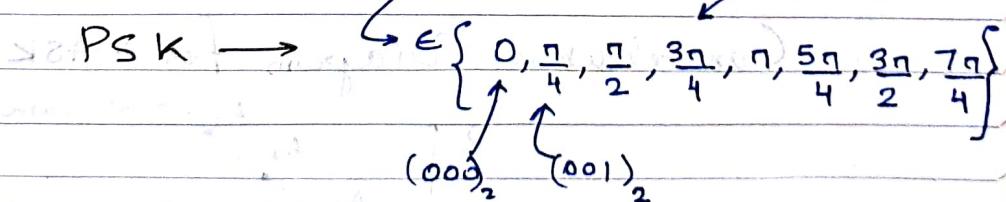

$\rightarrow T_{\text{symbol}}$

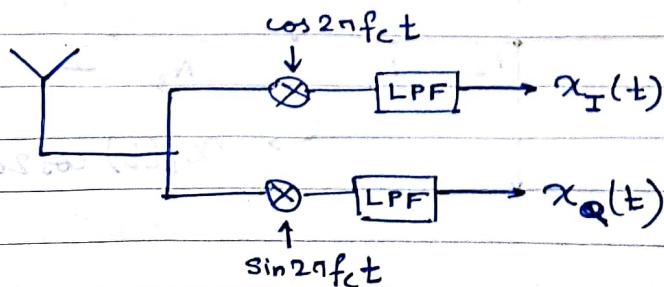

### 4-FSK

1 - MHz	00 <sub>2</sub>	}	trade-off: b/w
1.1 - MHz	01 <sub>2</sub>		
1.2 - MHz	10 <sub>2</sub>		
1.3 - MHz	11 <sub>2</sub>		

$$\text{PM} : \cos(2\pi f_{\text{c}} t + \phi_m(t))$$

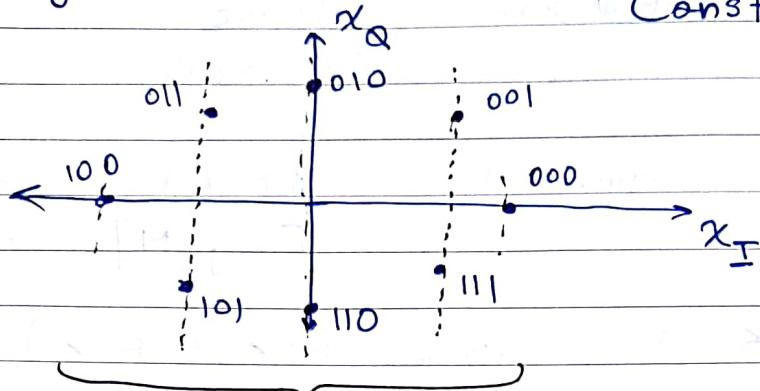

→ How to demodulate this

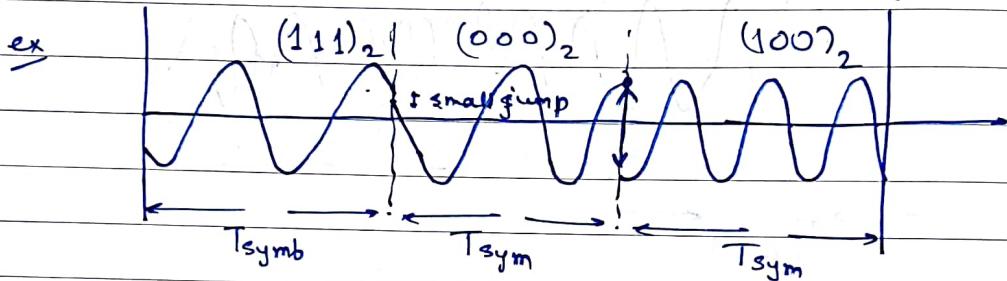

$$\phi_m = \tan^{-1} \left( \frac{x_Q(t)}{x_I(t)} \right)$$

→ Encoding in  $x_I$  and  $x_Q$

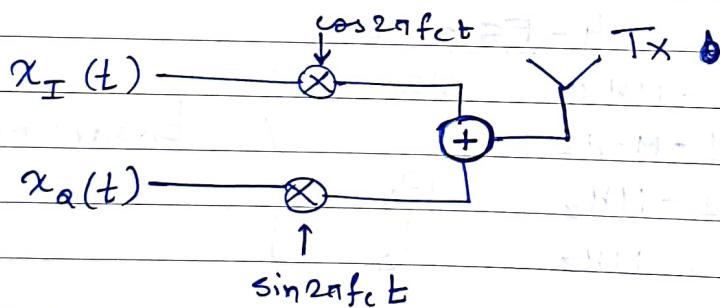

Constellation Diagram

5-Levels each for  $x_I$  &  $x_Q$

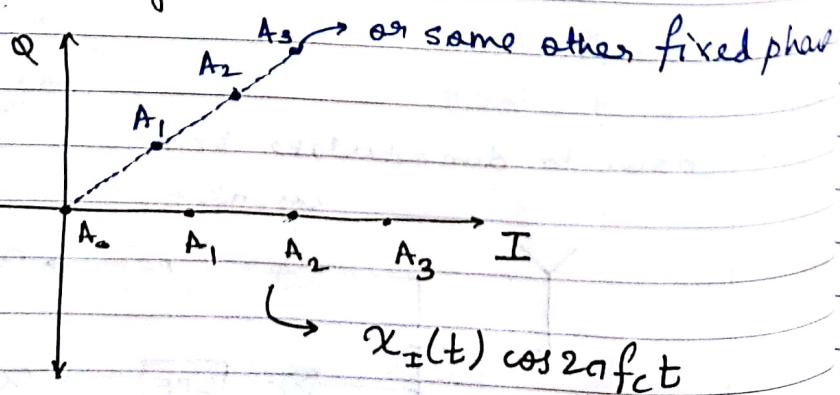

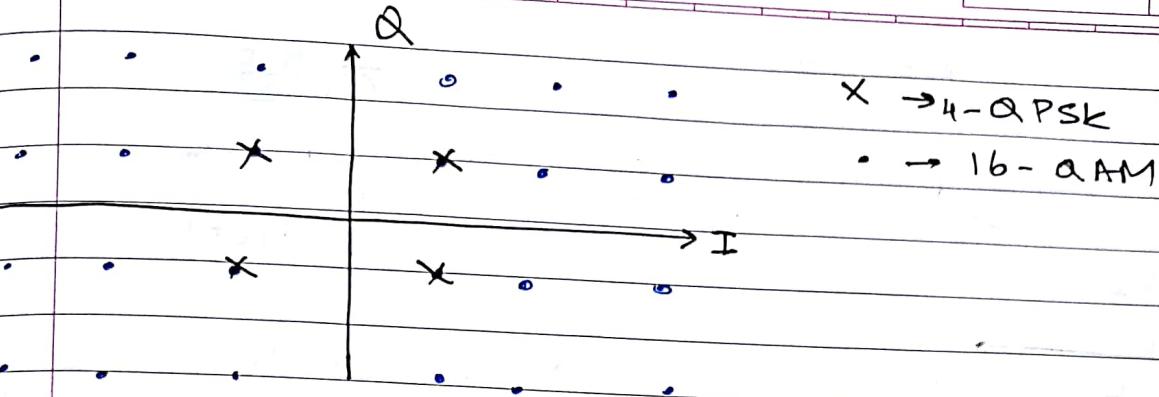

18.9.18

Bandwidth Efficiency =  $\frac{(\text{Bits/sec})}{\text{Hz}}$

Constellation Diagram for 4-ASK

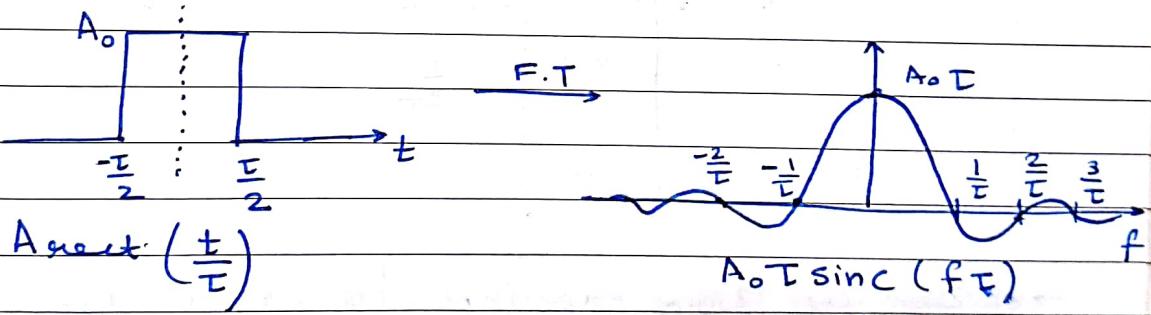

QAM: (General Case) : Quadrature Amplitude Modulation  
 ↪ General case

QPSK: Amplitude is constant  
 ↪ modified PSK

18.9.18

## Lecture

- Recap: Digital modulation Schemes

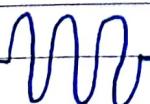

$$\text{sinc } x \triangleq \frac{\sin x}{x} \quad (\text{w/o Normalization})$$

$$\triangleq \frac{\sin(\pi x)}{\pi x} \quad (\text{Normalized})$$

- ASK (Digital AM)

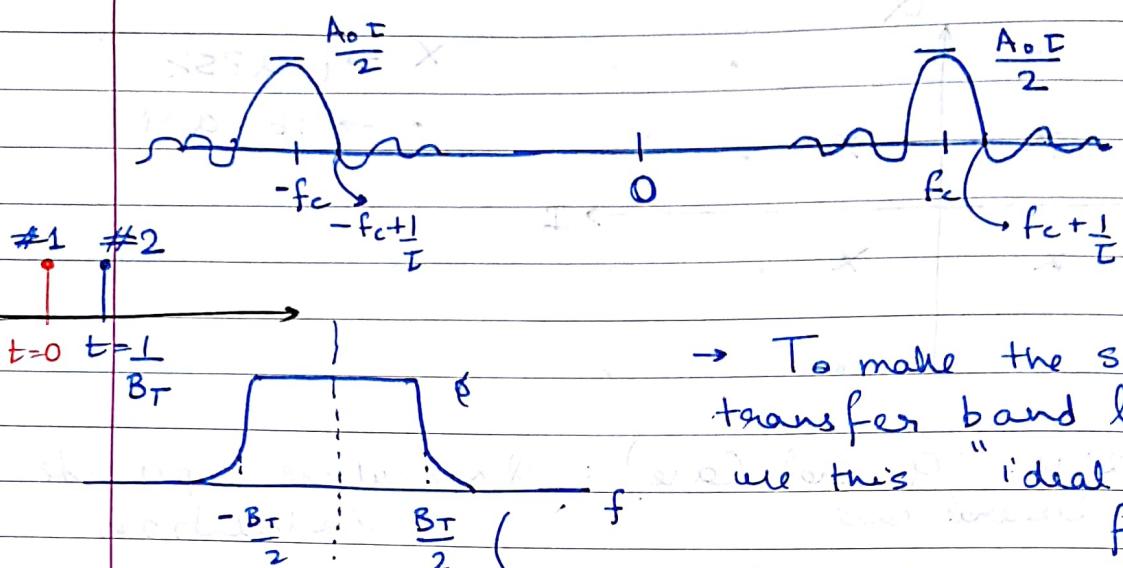

time domain

$$\rightarrow \frac{A_0 I}{2} \left[ \text{sinc}(f-f_c)T + \text{sinc}(f+f_c)T \right]$$

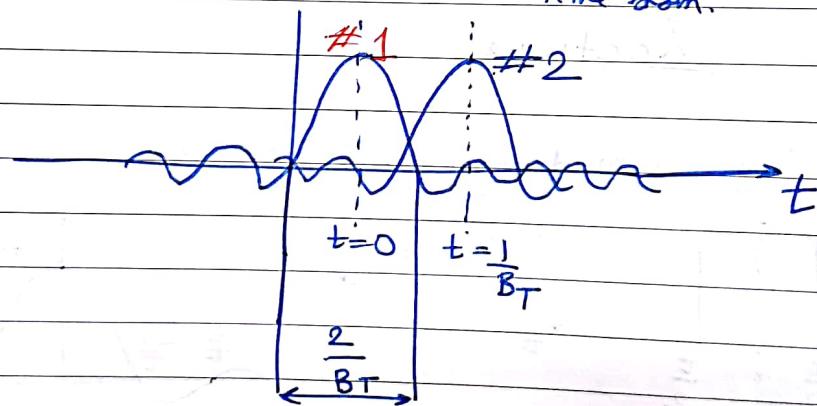

$$A_0 \cos 2\pi f_c t \times \text{rect}\left(\frac{t}{T}\right)$$

freq. domain

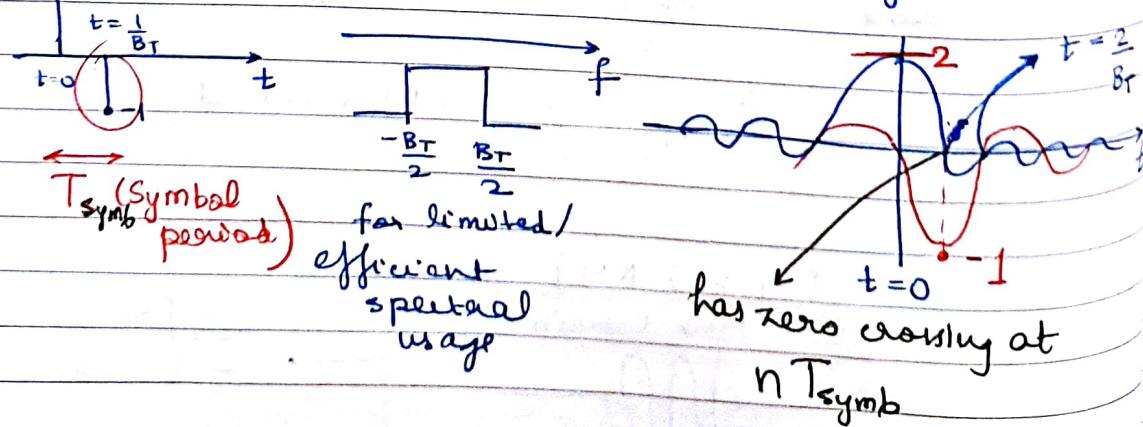

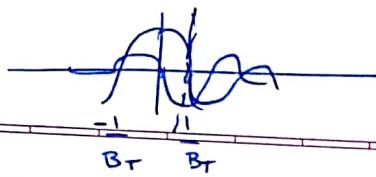

→ To make the signal transfer band limited we use this "ideal brickwall filter"

→ taking Convolution with its time domain  
in time dom.

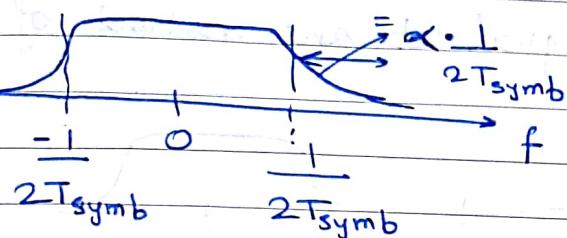

→ So we zero crossings to advantage,

$$B_T = \frac{1}{T_{\text{symb}}} (1 + \alpha)$$

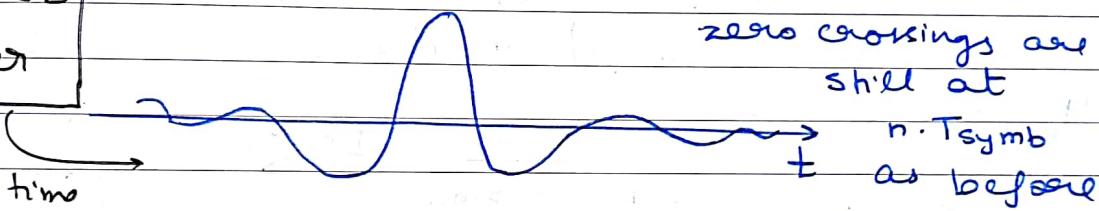

: Pulse shaping filter (PSF)

freq (Raised cosine filter)

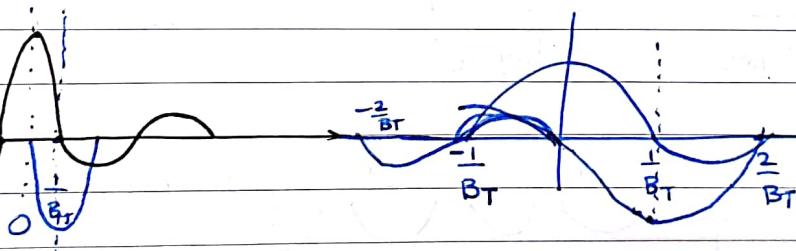

Impulse response

Sinc like shape with faster Roll-offs / Decays

Nyquist filter

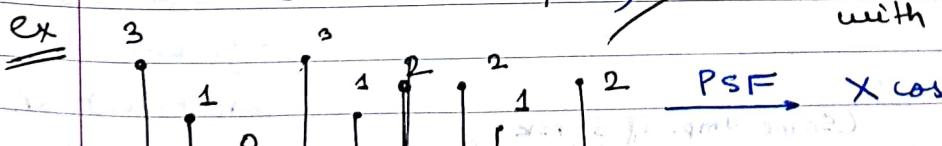

zero crossings are still at  $n \cdot T_{\text{symb}}$  as before

(Discrete samples)

in AM we Digital we simply  $\times$  Impulses with carrier

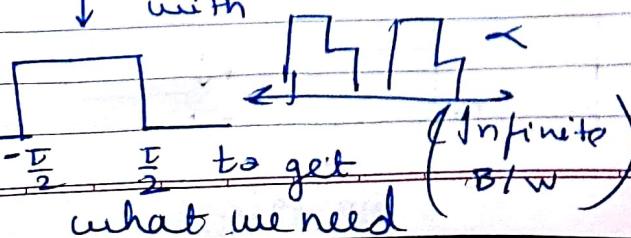

(Symbols)

$\times \cos(2\pi f_c t)$

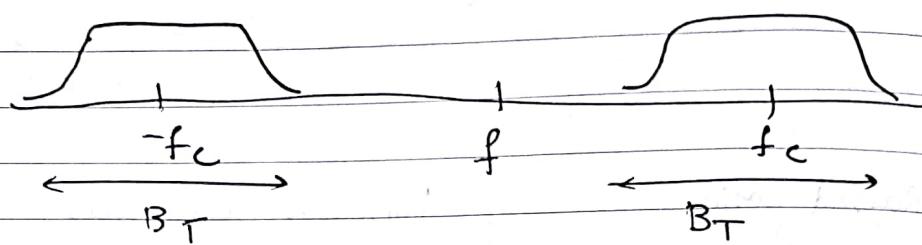

ASK pass band signal

can't convolve with

what we need

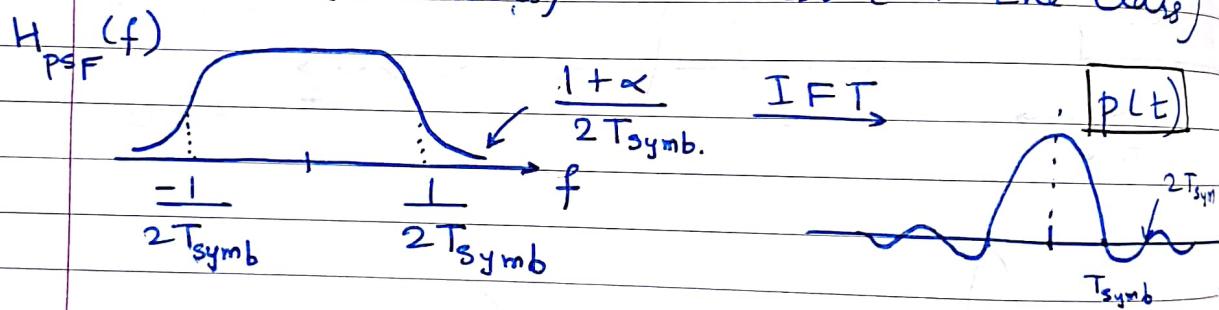

Pass-Band Signal at one instant of time

↳ Can be considered at one instant  
or an average

20.9.18

Crib Session: Wed 6-7 pm, MS, Q1, Q2  
Quiz (10 marks) on Thurs. (in the class)

101 001 011 101 000 011

$x_0 \quad x_1 \quad x_2$

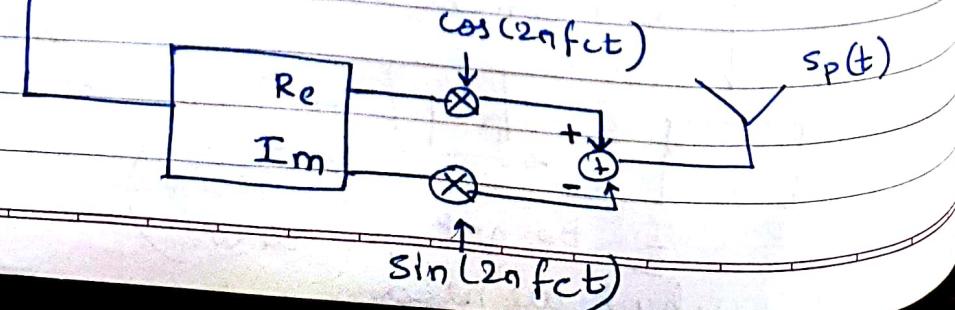

$x_0 \quad x_1 \quad x_2 \dots$

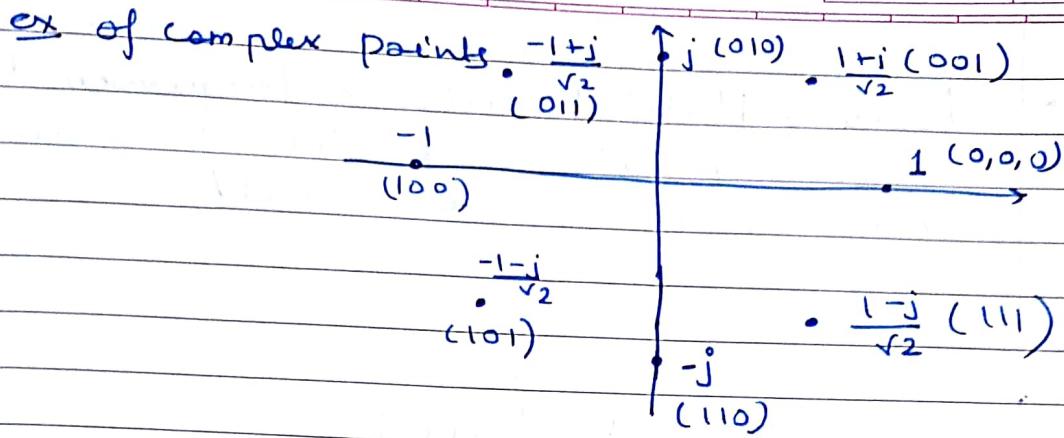

(Same amp. if 8-PSK  
different for QAM)

Intra  
ex all  
for

Complex  
symbols  
(Constellation  
points)

$$x_{BB}(t) = \sum x_k p(t - kT_{\text{symb}})$$

ex Transmit 101 :  $\frac{-1-j}{\sqrt{2}}$

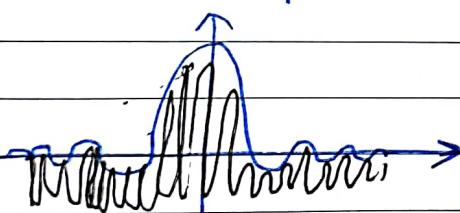

$$\text{Re} \left[ \left( \frac{-1-j}{\sqrt{2}} \right) \times p(t) \times [\cos 2\pi f_c t + j \sin 2\pi f_c t] \right]$$

transmitted signal,

$$= \frac{p(t)}{\sqrt{2}} (-\cos 2\pi f_c t + \sin 2\pi f_c t)$$

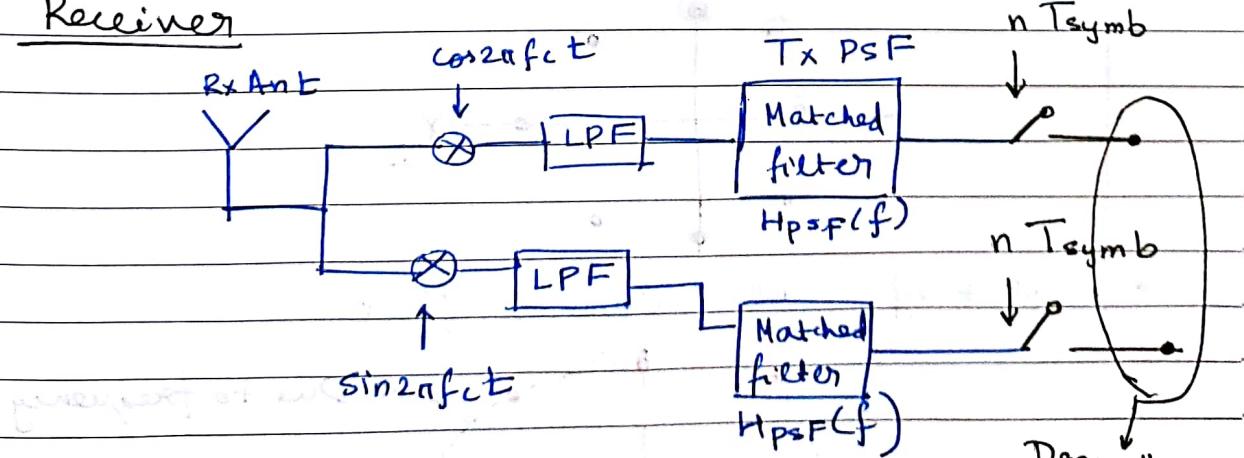

envelope

determines phase

(Alignment required pos.)

### Receiver

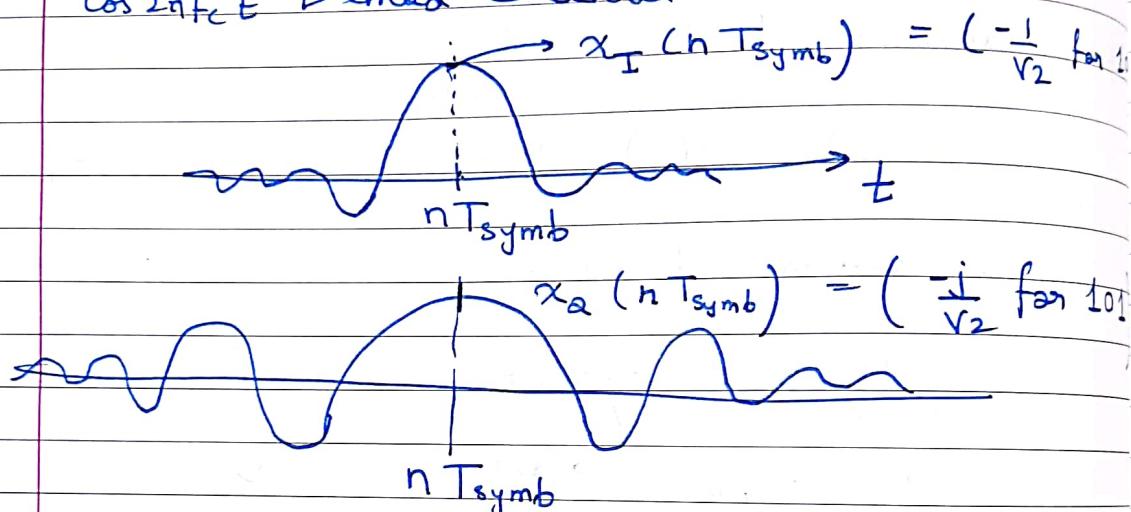

(Matched Filter: Gives best SNR)

Received constellation  
Drawing

→ Applying Matched filter in frequency domain is convolution with same sinc like time domain waveform ( $p(t)$ ) with itself.

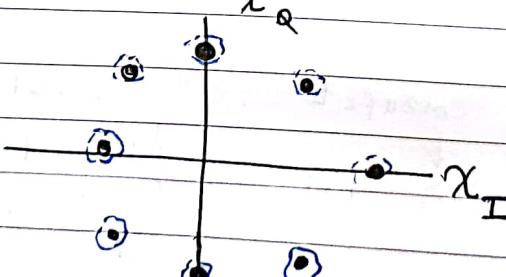

O/P

$\cos 2\pi f_c t$  Demod Channel

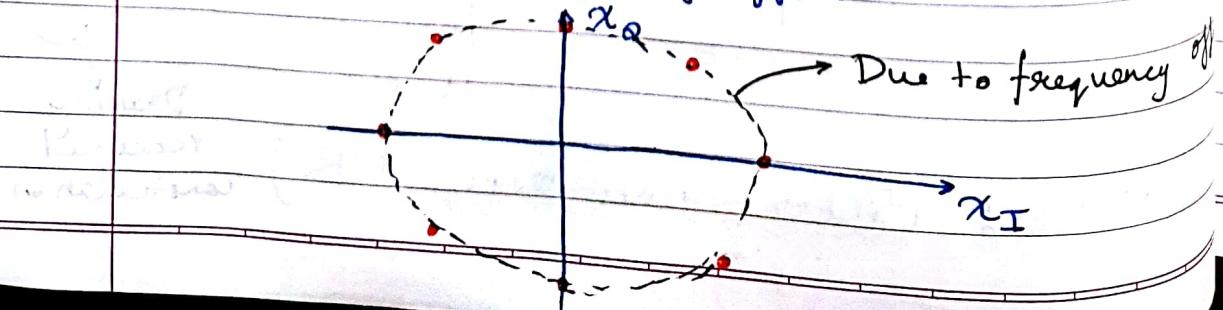

→ Received Complex Symbol

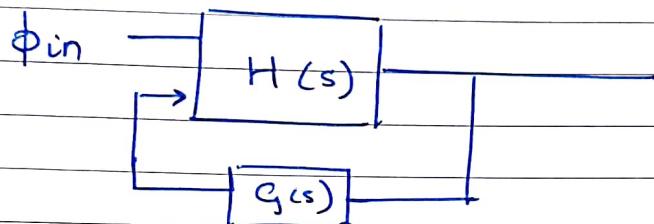

$$= x_I(nT_{\text{symb}}) + j x_Q(nT_{\text{symb}})$$

→ Effect of Small frequency offset:

- { Solution: Precise Coherent detection,  
 Coarse Adjustment: FLL (with Band-edge filters)  
 Fine Adjustment: Costas Loop  
 ↳ Also does phase in addition to freq.  
 ↳ just like -ve feedback in op-amp

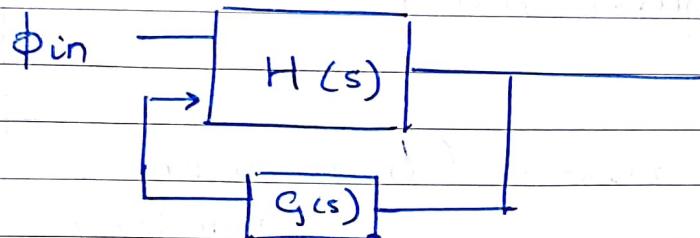

- Sampling time issues

say  $T_{sym} = 1\ \mu s$  & receiver  $\rightarrow$  has  $0.99\ \mu s$   
 even then as  $n \uparrow$   $nT_{sym}$  will have a  
 large mismatch

- Precise  $T_{symbol}$  matching important

 even then as  $n \uparrow$ ,  $nT_{sym}$  will have a  
 large mismatch

- Precise  $T_{symbol}$  matching important

24.9.18

### Carrier Phase / Freq. Offset

At  $t = nT_s$

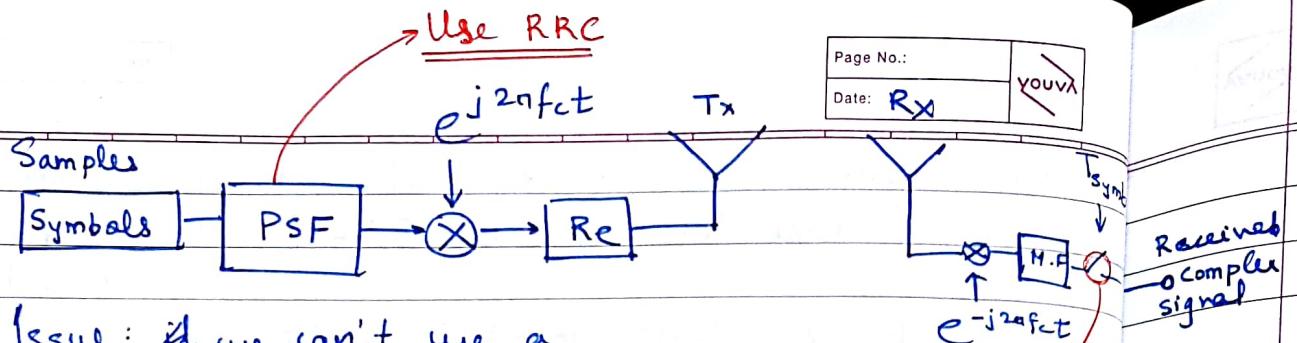

$$x_I \cos(2\pi \Delta f t) + x_Q \sin(2\pi \Delta f t)$$

$$x_Q \cos(2\pi \Delta f t) - x_I \sin(2\pi \Delta f t)$$

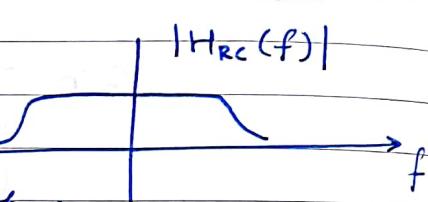

$$\begin{bmatrix} x_2 \\ y_2 \end{bmatrix} = \begin{bmatrix} \cos t & \sin t \\ -\sin t & \cos t \end{bmatrix} \begin{bmatrix} x_1 \\ y_1 \end{bmatrix}$$

(can see it as  
 ↳ Multiplication  
 with Rotation  
 Matrix)

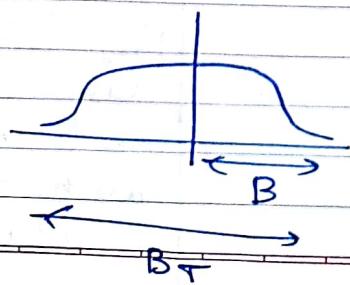

NA

- Issue: if we can't use a RC (raised cosine filter)
- Recap: RC filter was a Nyquist filter
- If we square it (In frequency domain)
  - then we lose the No Interference at sampling point property

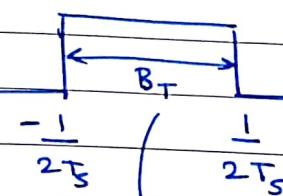

- Solution: Root Raised Cosine (RRC) =  $\sqrt{H(f)_{RC}}$
- Implementation in GNU Radio
  - samples:  $(-\frac{1}{2}, -\frac{1}{2})$
  - use RRC ( $B_T$ )
  - Bit Stream (Random) → Symb. out → PSF → Polyphase Ab. Resampler →  $e^{j2\pi f_{c}t}$  → TX → USRP block (using RTL-SDR for transmitter)
- Using Polyphase Arbitrary Resampler

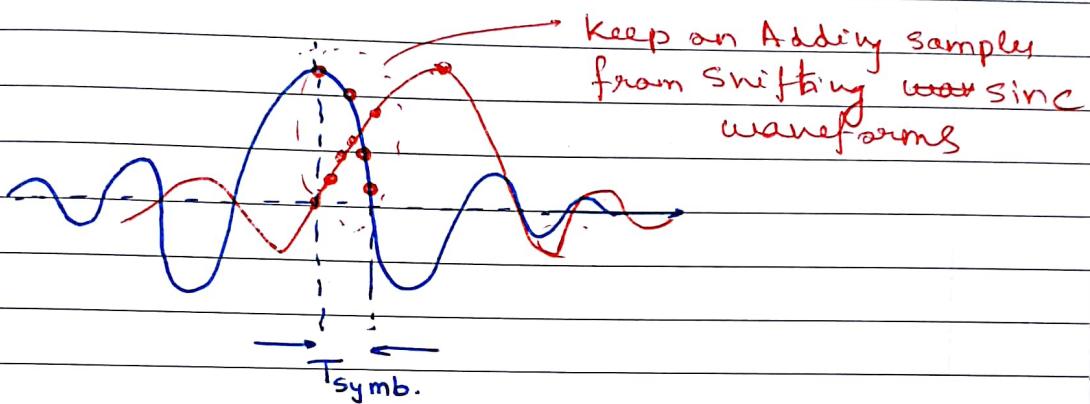

$$f_s \geq 2B$$

$$f_s \geq B_T$$

*Best Case / Ideal*

→ parameter: Samples/symbol (sp/s)  
= 4 here

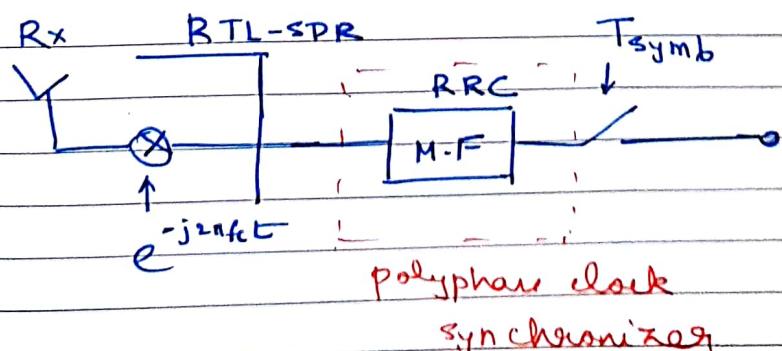

How to choose sps = f\_s

Nyquist Criterion :  $f_s \geq B_T$

$$f_s \geq \frac{1 + \kappa}{T_{\text{symb}}}$$

$$\kappa \in (0.1, 0.4)$$

$\kappa$ : Excess Bandwidth factor

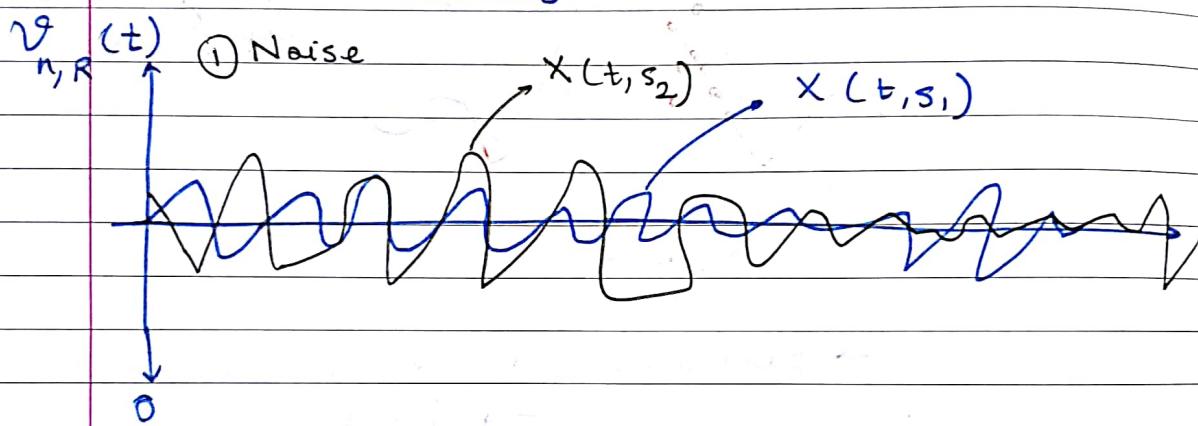

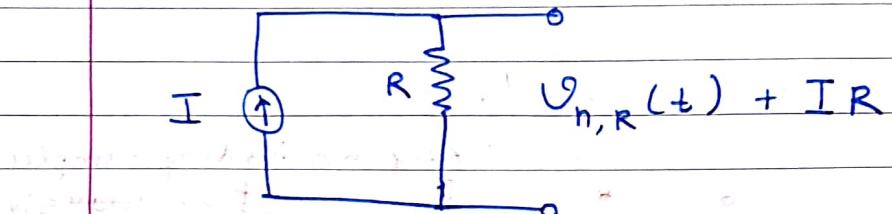

ATNA

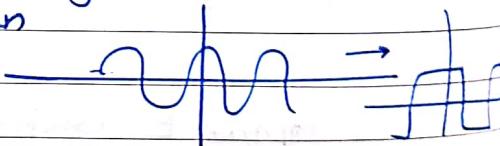

25.9.18

Page No.:  
Date:  
YOUVA

→ In Digital comm. FSK & PSK are interchangeable  
(Permitting is Difference reasoning)

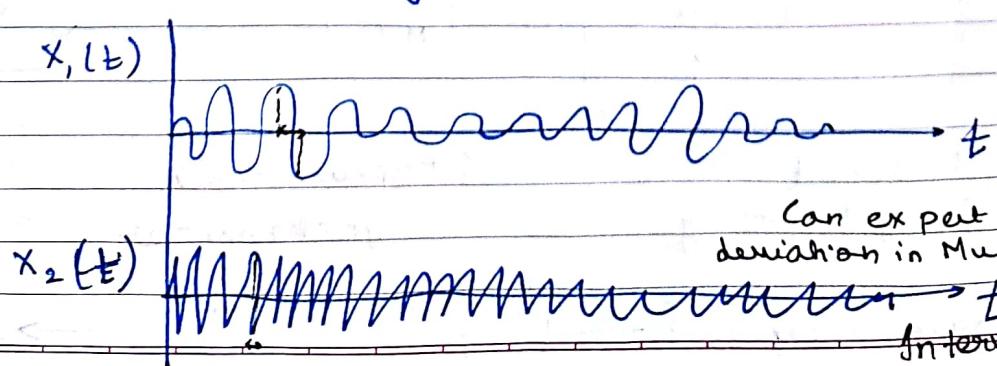

- Other Distorting/Degrading processes  
 ② Non-Linear Amplification

### ③ Interference

- Random Variables :  $x(t_1), x(t_2), x(t_3)$   
 A unique RV for every time instant  
 Random var.

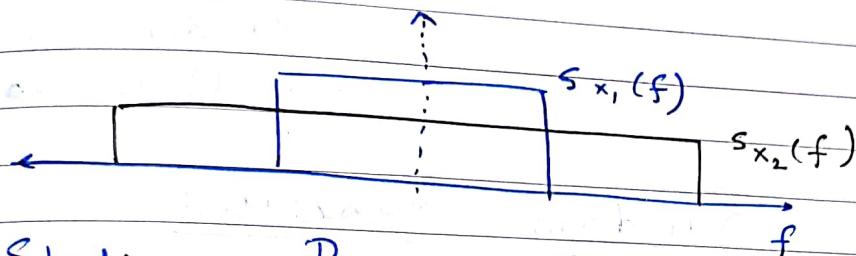

→ Time evolution of Random variables

Can expect same deviation in much smaller time intervals

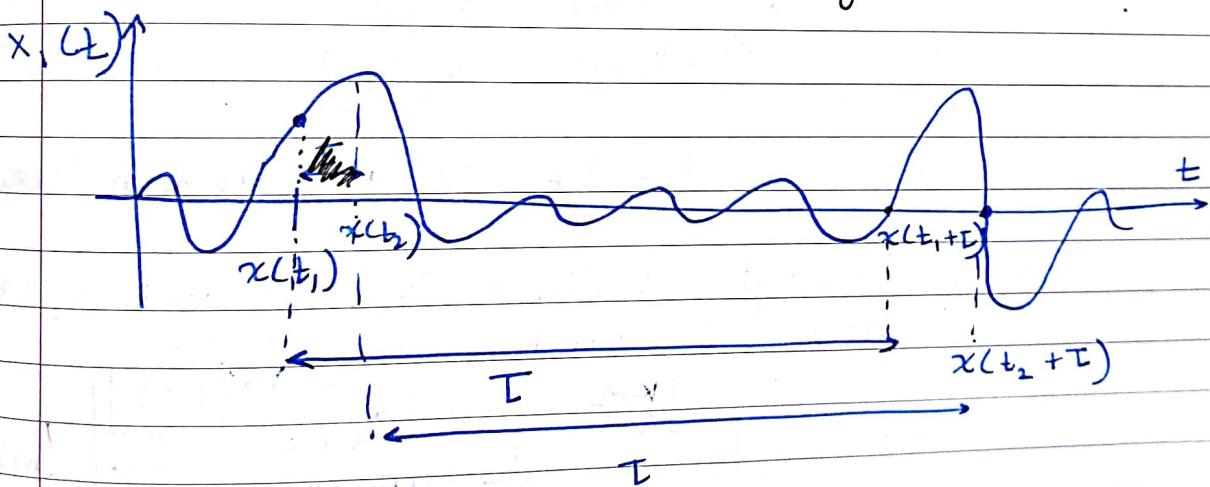

terchaay  
)

$x_1$  and  $x_2$  may have same moments, but they are still different due to their frequency content

→ Stationary Process: Statistical properties don't change over time.

### Strict Sense Stationary

$x_2(t)$ : Similar:

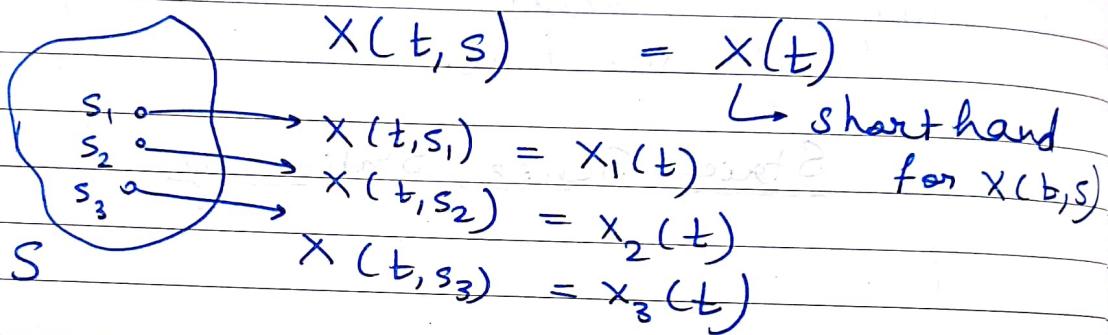

→ If the joint distribution of

$$x(t) = \sin(2\pi f_0 t + \theta)$$

$\hookrightarrow$  If  $\theta$  is a random number, then  $x(t)$  is a R.P.

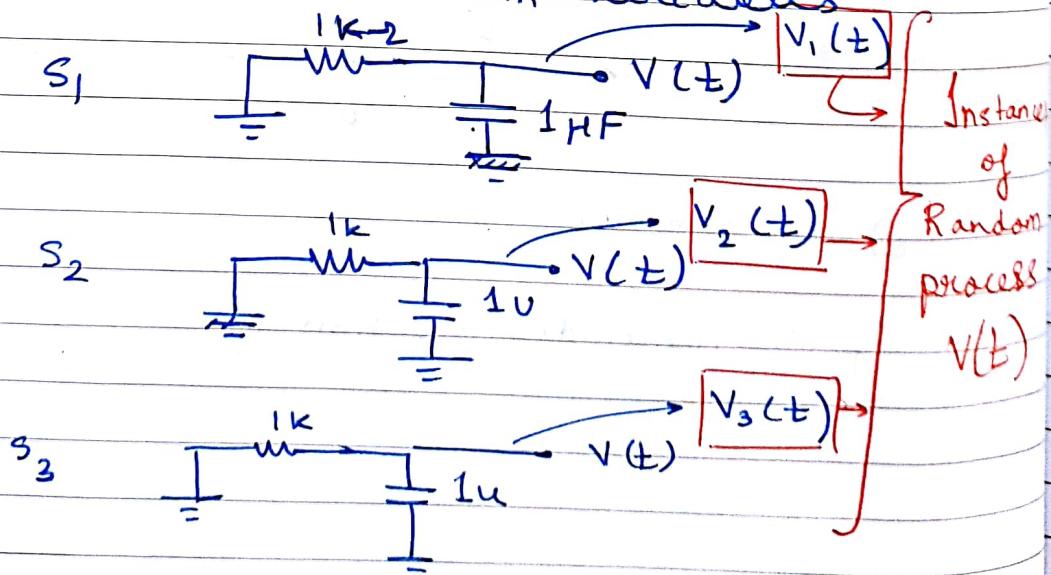

27.9.18

## Random Processes

$x(t)$  at  $t = t_k$  is a Random Variable

i.e., all 3 of  $x_1(t_k)$ ,  $x_2(t_k)$  and  $x_3(t_k)$  are 3 random variables

$V(t_k)$ : A Random variable with instance  $V_i(t_k)$

- Each time instant is associated with a Random Variable
- ~~Y(t)~~  $X_i(t)$  is a waveform, inst. of Rand. Process.

then  
P  
, then  
D  
, then  
S  
  
• Density & Distribution for Random processes

→ R.V :  $X(t_k)$ :

$$\mu_x(t_k) = \text{IE}[X(t_k)]$$

• Stationary Process  $\Rightarrow \mu_x(t_k) = \mu_x \forall t_k$   
one way implication

In General : Strict Sense Stationary

$$F_{x(t_1), x(t_2), \dots, x(t_k)}(x_1, x_2, \dots, x_k) =$$

$$F_{x(t_1+\tau), x(t_2+\tau), \dots, x(t_k+\tau)}(x_1, x_2, \dots, x_k)$$

for every  $\tau$   
and  $\forall k$

→ Why do we need joint Distribution?

→ The Marginal / Individual Distribution is constant at all points, but PSD changes with time
