## 1 Hilbert Transform

Intuitively, the Hilbert transform of a signal applies a phase change of 90 degees. Formally the Hilbert transform  $\hat{x}(t)$  of a signal x(t) is the output corresponding to the input x(t) of the LSI system defined by the following frequency response.

$$H(f) = \begin{cases} -j & f > 0 \\ 0 & f = 0 \\ j & f < 0 \end{cases}$$

Convince yourself that the Hilbert transform corresponding to cos(t) is sin(t).

Q: What is the Fourier transform of  $x(t) + j\hat{x}(t)$ ?

Q: What is the Fourier transform of  $x(t) - j\hat{x}(t)$ ?

## 2 Hilbert Transform in GNURadio

The Hilbert Transform block in GNURadio generates the complex output  $x(t) + j\hat{x}(t)$  corresponding to the input x(t). In other words, for input real x(t), the imaginary part of the block output is the actual Hilbert transform of x(t).

Q: Is the Hilbert transform of a real signal guaranteed to be real?
